

COMP6452 - Group 23

Milk chain

(Food supply chain)

Presentation 1

Boyang Li (Eric)	z5191532	-	Functional & Non-Functional requirement
Zhiyang Lin (Kilam)	z5142124	-	System Architecture Diagram & Comparison
Kaiying Wu (Kathy)	z5251751	-	Chosen Domain, Challenges & Proposal Plan
Yunpeng Zhuo (Tony)	z5221263	-	Blockchain Suitability Assessment

Challenges in the Milk Supply Chain

Key Stakeholders/Participants:

Farmers, Processors, Retailers, Consumers

Challenges

#1: Lack of Transparency & Traceability

Tracing milk from source to consumer is unclear and complex.

#2: Centralization of Operations

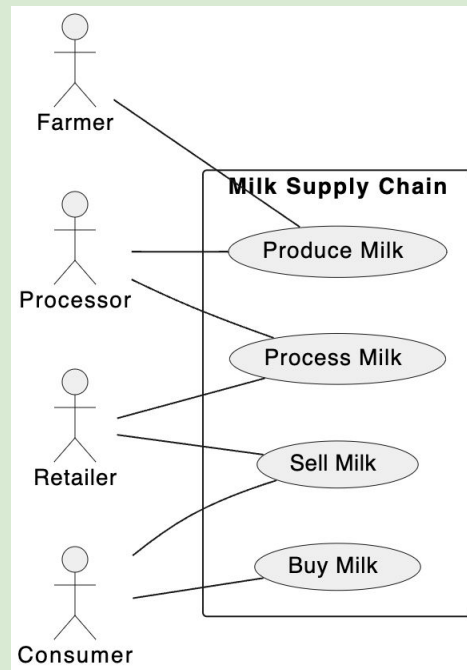

Centralized operations lead to inefficiencies and slower responses.

#3: Need for Multi-Party Interactions

The milk supply chain requires seamless interaction between multiple parties.

#4: Data Immutability

Maintaining an accurate record of a product's journey is crucial.

Functional & Non-Functional requirement

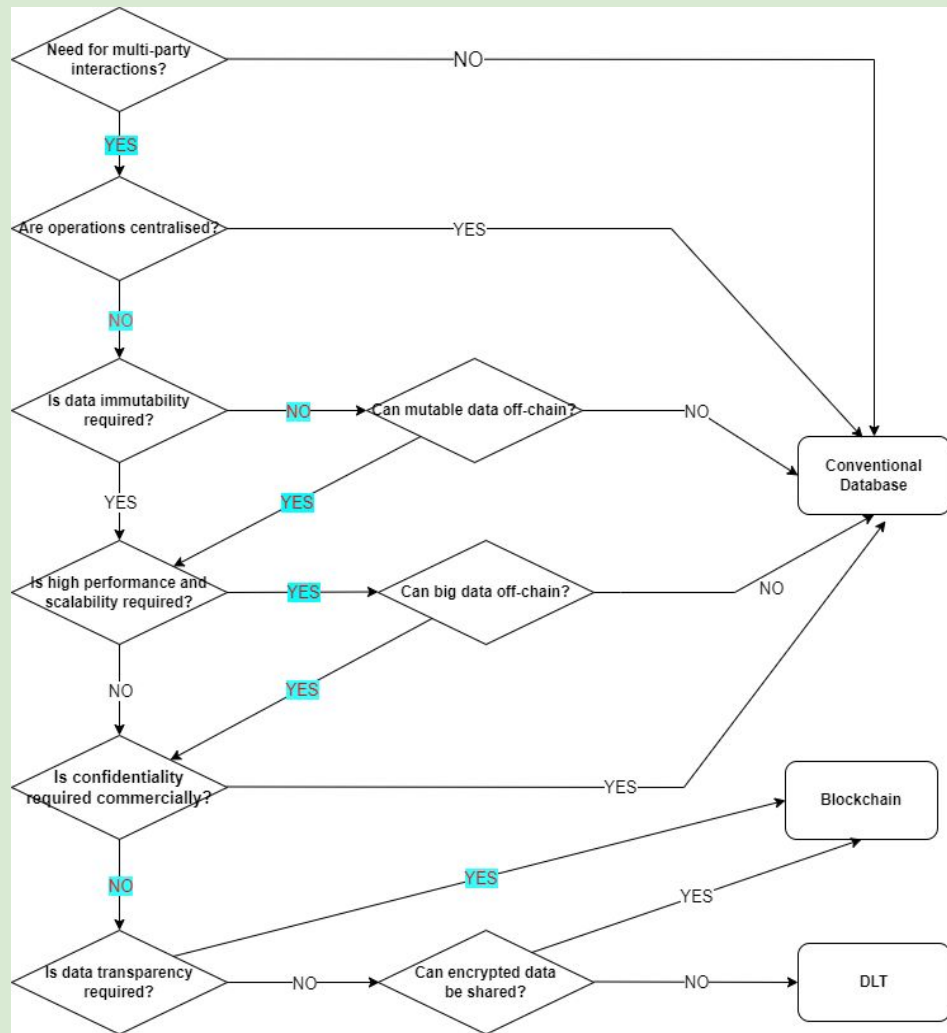

Functional:

- The system should be able to record and store milk source data.
- The system should be able to record and track the journey of the milk.
- The system should be able to report any anomalies at any point of the supply chain.

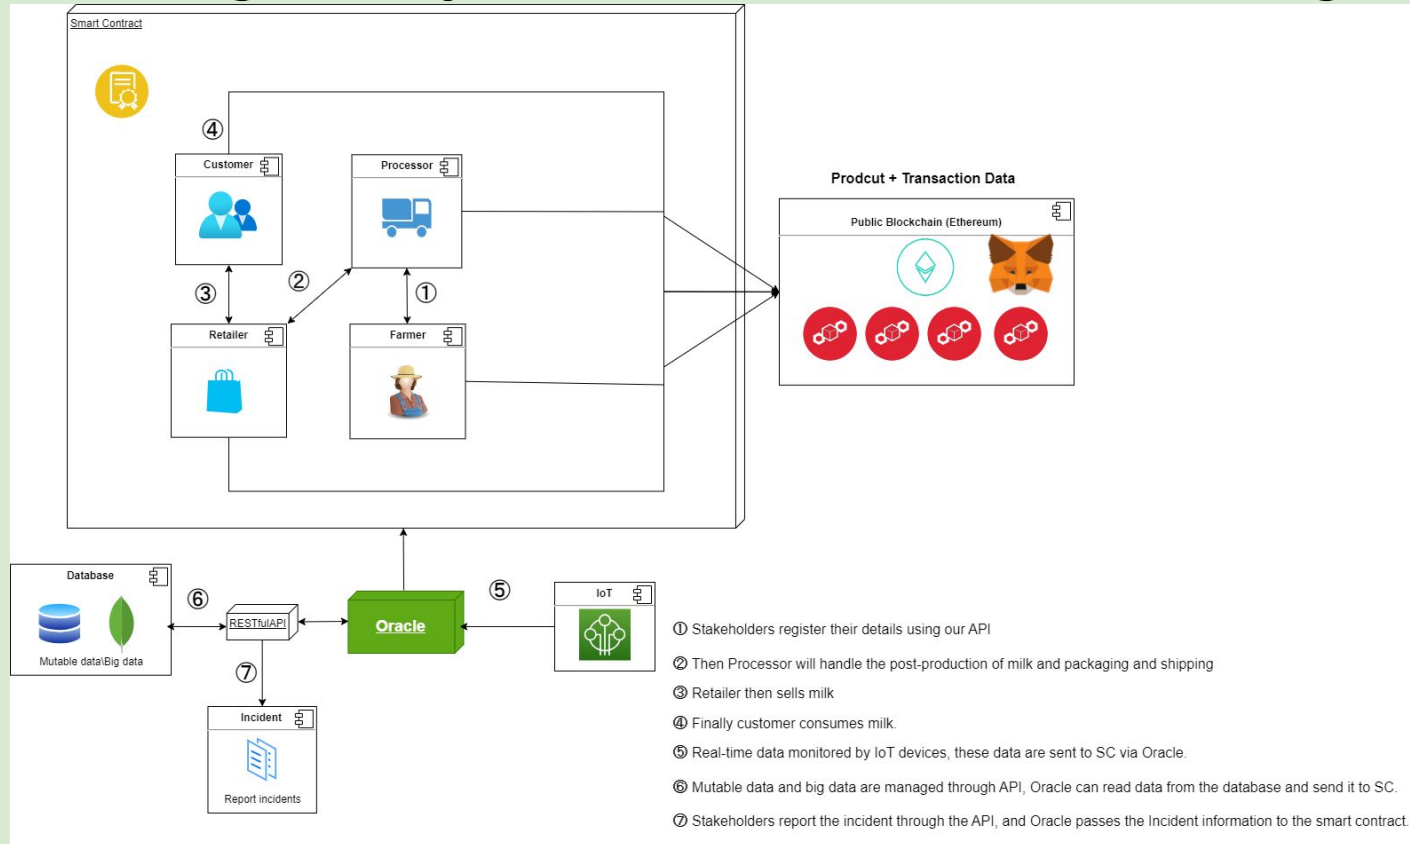

Non-Functional:

- The system must ensure the confidentiality, integrity, and availability of data.
- The system must be scalable and maintain high performance given the high volume of transactions that can occur in the milk supply chain.
- The system must be interoperable with existing IT infrastructure used by all parties.
